ASKING THE RIGHT QUESTIONS ABOUT CUTANEOUS SQUAMOUS CELL CARCINOMA (CSCC)?

CSCC is the second most common skin cancer in the U.S.,1 but people may not know much about it. Start by knowing what to ask.

HOW COMMON IS CSCC REALLY?

~700,000 people in the U.S. are diagnosed each year—more than 7 times the number of people diagnosed with melanoma.2,3,4,5,6

* As of 2012

AM I AT RISK FOR CSCC?

CSCC usually affects areas on the body that are exposed to the sun.7 Certain factors can increase your risk for CSCC over time:

TIME IN THE SUN
Cumulative exposure to ultraviolet (UV) light

LOCATION
Living in southern states8

AGE
People age 65 & over9

GENDER
Men are three times more likely than women to get CSCC.10

CAN CSCC SPREAD TO OTHER PARTS OF THE BODY?

Yes, and that can make it deadly. Although typically treatable when caught early, CSCC can be difficult to treat when it becomes locally advanced or metastatic.5,10

HERE’S A QUESTION FOR YOU:
WHAT SHOULD YOU DO IF YOUR CSCC KEEPS COMING BACK OR IS BECOMING ADVANCED IN OTHER WAYS?

Be proactive. Follow up with your doctor to find out how advanced your CSCC is and explore all treatment options.
